# HIGH FLOW OXYGEN THERAPY IN **GENERAL PAEDIATRIC WARDS**

### AIM

- To develop an evidence-based protocol for the use of high flow oxygen therapy (HFOT) in paediatric wards at district hospitals in the Kwa-Zulu Natal (KZN) province
- To guide medical staff on safe application of HFOT

#### BACKGROUND

- In KZN, pneumonia remains the second cause of deaths in children <5 years outside the neonatal age
- Respiratory support modalities at district hospitals are limited
- HFOT potentially reduces the rate of intubations <sup>2,3</sup>
- HFOT has been used in remote areas without

# **BENEFITS OF HFOT**

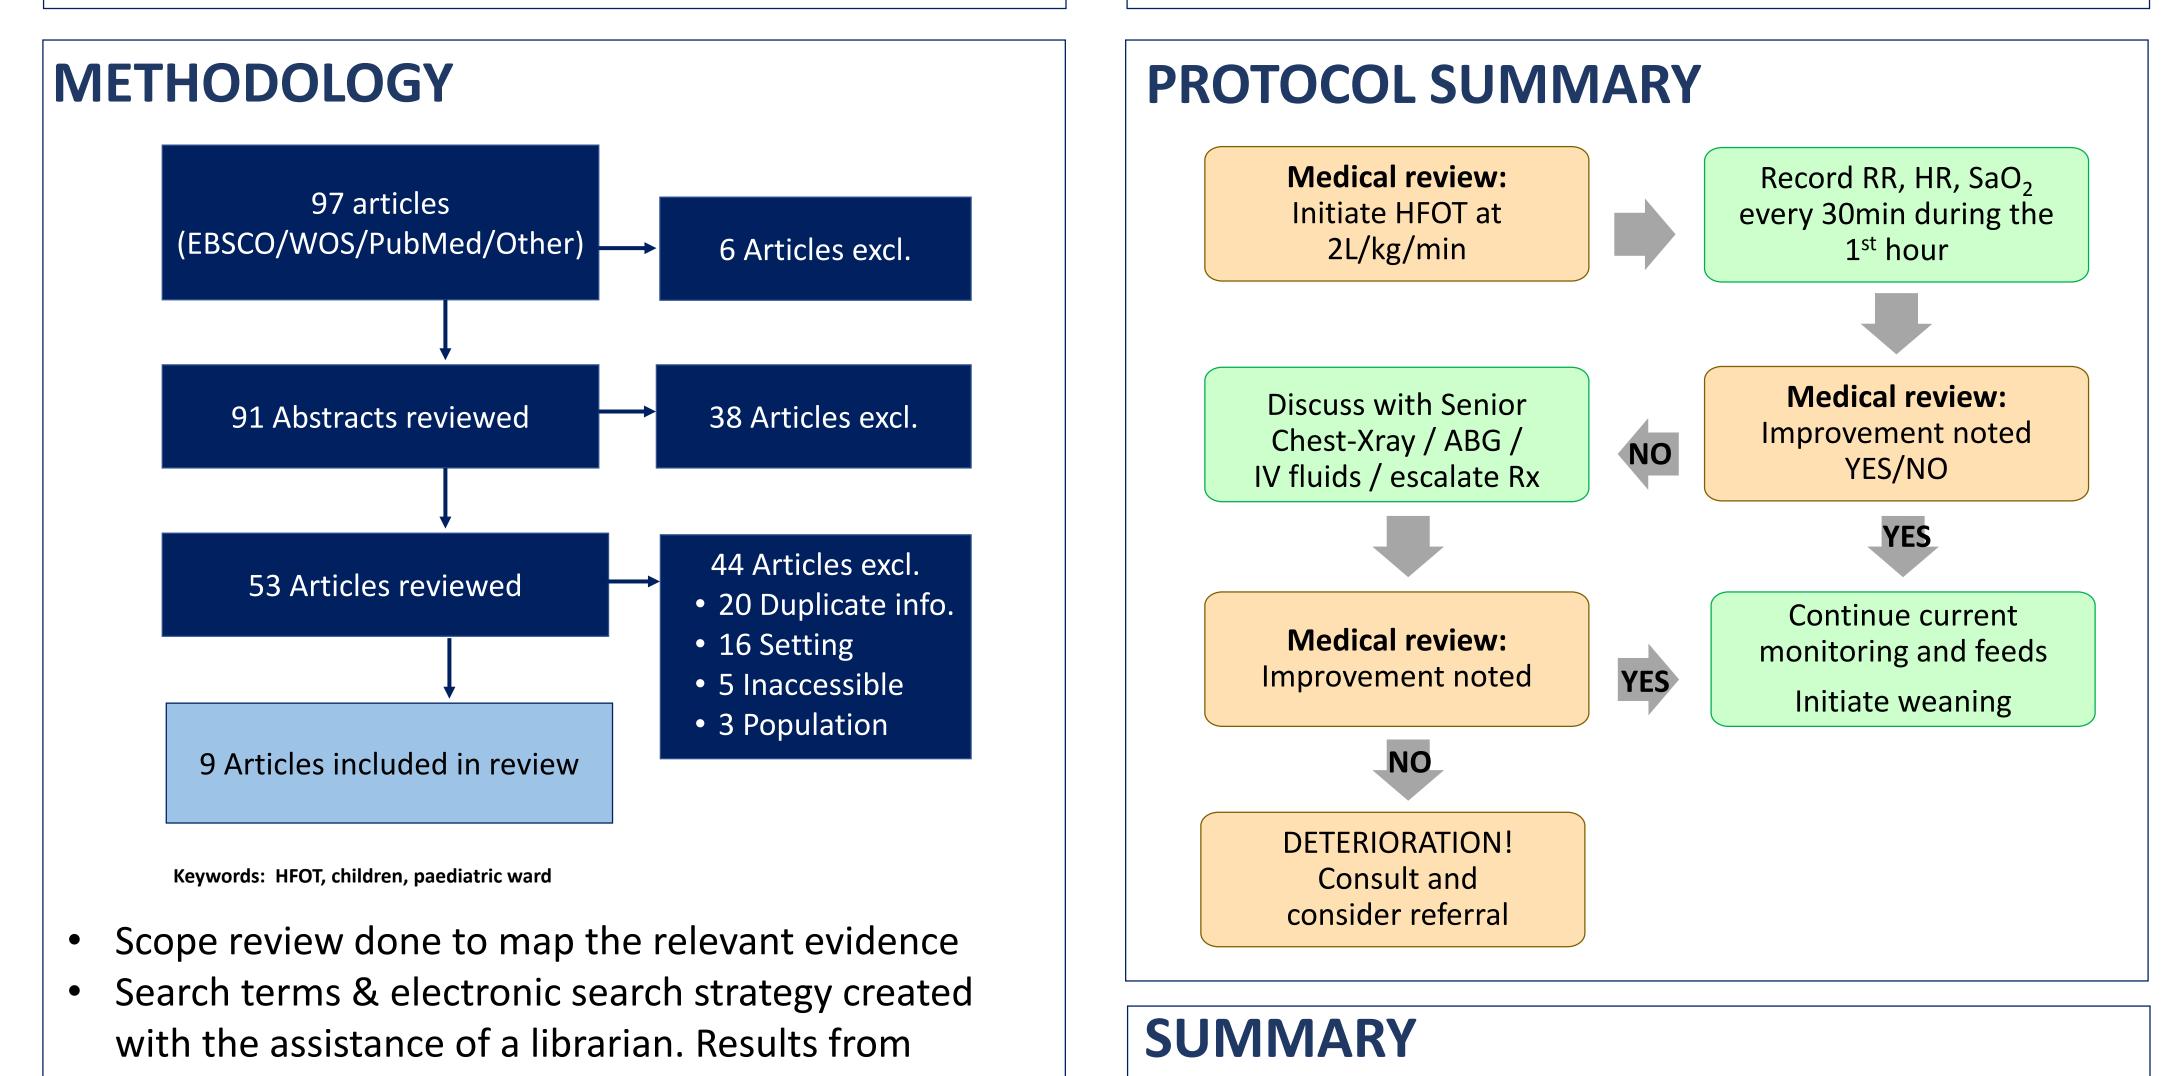

- Provides warm humidified air which thins secretions ulletthereby increasing patient comfort<sup>3</sup>
- Improves partial pressure of oxygen and carbon dioxide resulting in reduce work of breathing <sup>3</sup>
- Generates positive airway pressure, resulting in end expiratory pressure effect thereby increasing functional residual capacity <sup>3</sup>
- Washout of upper-airways reduces dead space <sup>3</sup>
- Decreases entrainment of room air = increased  $\bullet$ inspired fraction of inspired oxygen

## **LIMITATIONS OF HFOT**

- Variable pressures generated are not quantifiable lacksquare
- Flows of 2L/kg/min can result in very high flow rates for younger children<sup>3</sup>.

intensive care unit support, it is safe with fewer complications <sup>1,3</sup>

HFOT may mask early signs of deterioration<sup>1,3</sup> lacksquare

- databases attained
- Summary synthesis was created from final studies selected
- Three clinical guidelines on HFOT identified and  $\bullet$ appraised using the AGREE II Instrument
- The guideline with highest rating was adapted for use
- Recommendations formulated using appraised guideline and summary synthesis
- An evidence-based practice protocol was developed

- There is little evidence on the use of HFOT outside the intensive care unit setting
- The patient's response to HFOT during the first hour will determine outcome<sup>1</sup>
- True predictors of failure of HFOT are not known ullet
- HFOT should not delay intubation if decompensation is suspected <sup>1</sup>
- To date, there is no trial on whether to start with HFOT or to use when other respiratory care modalities fail
